Bluetooth

Communication protocol for PC peripheral devices

Bluetooth and others evolution

More bandwidth, but one exception

Wi-Fi	
802.11	2Mbps
802.11b	11Mbps
802.11g	54Mbps
802.11n	135Mbps

Ethernet	
802.3i	10Mbps
802.3u	100Mbps
802.3ab	1000Mbps
802.3an	10000Mbps

Bluetooth	
v1.1	1Mbps
v2.0	3Mbps
v3.0	54Mbps
v4.0 (BTLE)	0.3Mbps

Bluetooth low energy

It's good at small, discrete data transfers

Bluetooth Low Energy

- A new radio, new protocol stack, new profile architecture and a new qualification regime

Bluetooth Low Energy

- A new radio, new protocol stack, new profile architecture and a new qualification regime
- It's designed to run from coin cells

Bluetooth Low Energy

- A new radio, new protocol stack, new profile architecture and a new qualification regime
- It's designed to run from coin cells
- New advertising mechanism, for ease of discovery & connection

Bluetooth Low Energy

- A new radio, new protocol stack, new profile architecture and a new qualification regime
- It's designed to run from coin cells
- New advertising mechanism, for ease of discovery & connection
- Designed to be LOWEST cost and EASY to implement

Bluetooth Low Energy

- A new radio, new protocol stack, new profile architecture and a new qualification regime
- It's designed to run from coin cells
- New advertising mechanism, for ease of discovery & connection
- Designed to be LOWEST cost and EASY to implement
- Very small silicon footprint and thereby very low cost

Bluetooth Low Energy

- A new radio, new protocol stack, new profile architecture and a new qualification regime
- It's designed to run from coin cells
- New advertising mechanism, for ease of discovery & connection
- Designed to be LOWEST cost and EASY to implement
- Very small silicon footprint and thereby very low cost
- Very secure through optional 128 bit AES encryption

Bluetooth Low Energy

- A new radio, new protocol stack, new profile architecture and a new qualification regime
- It's designed to run from coin cells
- New advertising mechanism, for ease of discovery & connection
- Designed to be LOWEST cost and EASY to implement
- Very small silicon footprint and thereby very low cost
- Very secure through optional 128 bit AES encryption
- Very low power – designed to be asleep

Bluetooth Low Energy

- A new radio, new protocol stack, new profile architecture and a new qualification regime
- It's designed to run from coin cells
- New advertising mechanism, for ease of discovery & connection
- Designed to be LOWEST cost and EASY to implement
- Very small silicon footprint and thereby very low cost
- Very secure through optional 128 bit AES encryption
- Very low power – designed to be asleep

Bluetooth Low Energy

	Voice	Data	Audio	Video	State
Bluetooth ACL / HS	x	Y	Y	x	x
Bluetooth SCO/eSCO	Y	x	x	x	x
Bluetooth low energy	x	x	x	x	Y
Wi-Fi	(VoIP)	Y	Y	Y	x
Wi-Fi Direct	Y	Y	Y	x	x
ZigBee	x	x	x	x	Y
ANT	x	x	x	x	Y

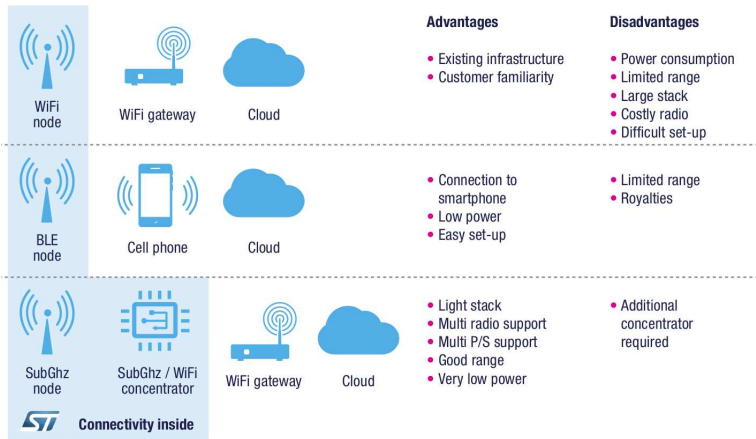

State = low bandwidth, low latency data

Low Power

- **Broadcaster:** Transmitter only
- **Observer:** Receiver only
- **Peripheral:** Supports slave role
- **Central:**
 - ▶ Supports master roles
 - ▶ Supports multiple connections
 - ▶ Initiates connections to peripherals

Note: One device may support multiple roles

Bluetooth Low Energy

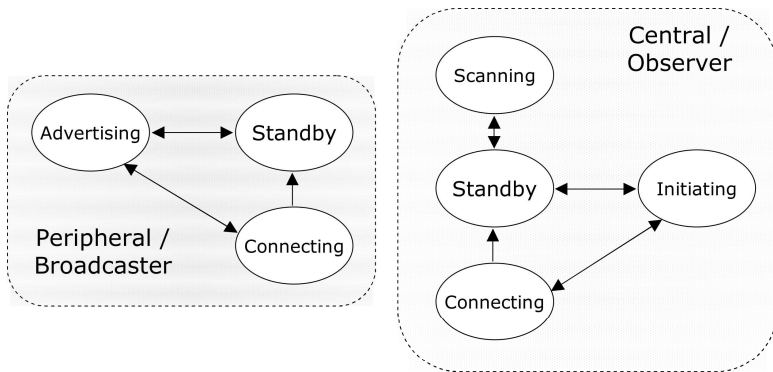

Advertising

- Broadcasting data. The way to let know to other devices that you are present.
- Transmit on all advertising cahnnel on each connection interval.
- Connectable or non-conectable.

Bluetooth LE Modes

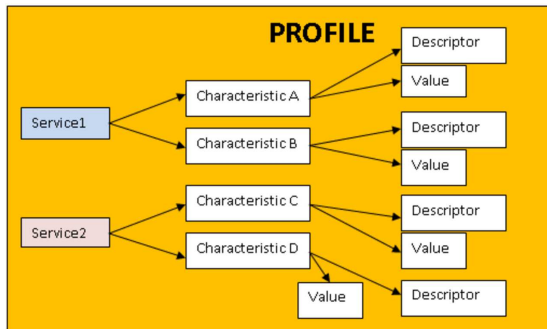

Bluetooth LE Modes

Once a connection is made:

- Master informs slave of hopping sequence and when to wake
- All subsequent transactions are performed in the 37 data channels
- Transactions can be encrypted
- Both devices can go into deep sleep between transactions.

Profile setup

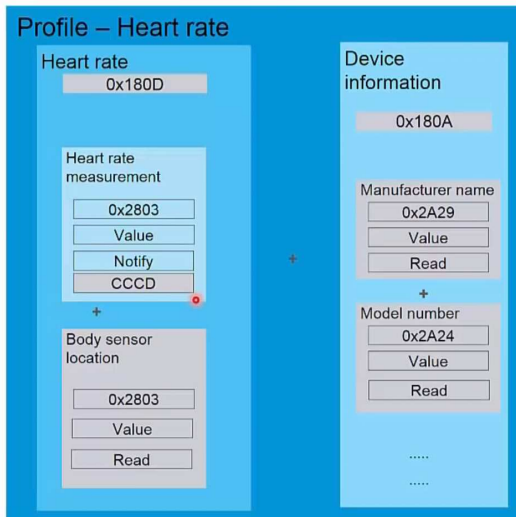

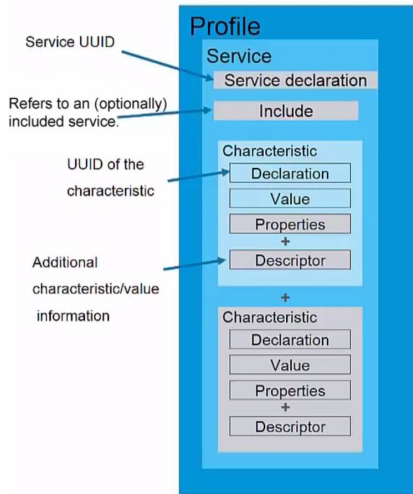

- **Profile:**

- ▶ In, BLE and application is considered as a Profile designed to exchange data.
- ▶ Overall application functionality

- **Service:** Sub-functionality that consists of characteristics.

- **Characteristics:** Performs its service functionality.

Profile example, heart rate

Bluetooth Low Energy Power Consumption

- BLE stack will only be consuming current at the peak level while it is transmitting.
- BLE device is transmitting only for a small percentage of the total time that the device is connected.

¹Texas Instruments, Measuring Bluetooth® Low Energy Power Consumption, Application Note AN092

Bluetooth GAP (Generic Access Profile) roles

Figure 2- Current Consumption versus Time during a single Connection Event

2

Bluetooth GAP (Generic Access Profile) roles

	Time [μ s]	Current [mA]
State 1 (wake-up)	400	6.0
State 2 (pre-processing)	315	7.4
State 3 (pre-Rx)	80	11.0
State 4 (Rx)	275	17.5
State 5 (Rx-to-Tx)	105	7.4
State 6 (Tx)	115	17.5
State 7 (post-processing)	1325	7.4
State 8 (pre-Sleep)	160	4.1

$$[(400 \mu\text{s}) \cdot (6 \text{ mA}) + (340 \mu\text{s}) \cdot (7.4 \text{ mA}) + (80 \mu\text{s}) \cdot (11 \text{ mA}) + (190 \mu\text{s}) \cdot (17.5 \text{ mA}) + (105 \mu\text{s}) \cdot (7.4 \text{ mA}) + (115 \mu\text{s}) \cdot (17.5 \text{ mA}) + (1280 \mu\text{s}) \cdot (7.4 \text{ mA}) + (165 \mu\text{s}) \cdot (4.1 \text{ mA})] / (2675 \mu\text{s}) = 8.2463 \text{ mA}$$

$$[(1000 \text{ ms} - 2.675 \text{ ms}) \cdot (0.001 \text{ mA}) + (2.675 \text{ ms}) \cdot (8.2463 \text{ mA})] / (1000 \text{ ms}) = 0.0230 \text{ mA} \quad 3$$

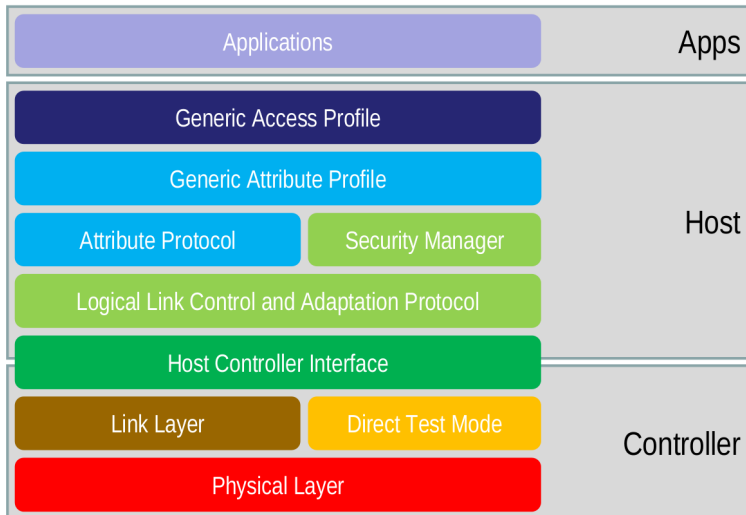

³ Texas Instruments, Measuring Bluetooth® Low Energy Power Consumption, Application Note AN092

Bluetooth GAP (Generic Access Profile) roles

$$(230mAh)/(0.023mA) = 10000 \text{ hours} = 416 \text{ days} = 1.14 \text{ years}$$
